Global mobile satellite communications (GMSC) are specific satellite communication systems for maritime, land and

aeronautical applications. It enables connections between moving objects such as ships, vehicles and aircrafts, and telecommunications subscribers through the medium of communications satellites, ground earth stations, PTT or other landline telecommunications providers. Mobile satellite communications and technology have been in use for over two decades. Its initial application is aimed at the maritime market for commercial and distress applications. In recent years, new developments and initiatives have resulted in land and aeronautical applications and the introduction of new satellite constellations in non-geostationary orbits such as Little and Big LEO configurations and hybrid satellite constellations as Ellipso Borealis and Concordia system. This book is important for modern shipping, truck, train and aeronautical societies because GMSC in the present millennium provides more effective business and trade, with emphasis on safety and commercial

communications. Global Mobile Satellite Communications is written to make bridges between potential readers and current GMSC trends, mobile system concepts and network architecture using a simple mode of style with understandable technical information, characteristics, graphicons, illustrations and mathematics equations. In my opinion, unless you're a total introvert, agoraphobic, disabled or too lazy to leave the house, your best bet to buy most things you need is locally. Go to the Yellow

Pages, read your local newspapers, drive around the shopping areas, go to local free ad websites and talk to people you know about what you need. I generally buy most of my stuff from the big department stores but if I need something like furniture, I'll check out the furniture stores on the poor side of the town because the prices for the same goods are often much cheaper than a store in the higher class part of town plus you can often haggle with the owner on a cash deal. By shopping on the poor side of town at supermarkets for food, you can often save several dollars on a load of groceries. Beyond that, I generally go to the thrift stores a few times a year to buy t-shirts, clothes and anything else that strikes my fancy as I look around. It's finally arrived: A book for engineers written by an engineer—and one that focuses on low-current systems. Habbieb T. Mansour, who has designed, built, and reviewed designs for hundreds of engineering projects, explores the design and construction of modern buildings in

this guide that will help you: check on the quantity and quality of what is to be delivered before design documents go out for tendering; unify the design packages of various engineers within an organization; personalize the design of systems while complying with local and international codes and client requirements; and ask for or perform the tests that will ensure systems meet your expectations. This step-by-step methodology manual is precise and direct to the point, and it includes an appendix, photos and illustrations, and charts. Checklist templates at the end of each chapter help you check an engineer's work. Whether you are a low-current engineer, information and communication technology engineer, electrical engineer, building service engineer, project manager, facility manager or engineering student, you'll be equipped to learn and do your job with the Low- Current Systems Engineer's Technical Handbook.
